

# MODULÄRT DATACENTER **EFFEKTA GUARDIAN**

(Skräddarsydd lösning för mindre till medelstora serverrum.)

## Grundprincipen

Effekta Guardian är ett modulärt och slutet datacenter med stora möjligheter för kundanpassning i antal platser för servers, typ av kyldning, brandbekämpning och strömförsörjning via UPS.

## Presentation

Dagens datacenter förbrukar mycket energi, inte bara för serverna i sig, utan även för att all aktiv utrustning kräver kyldning. Samtidigt som själva säkerheten och tillgängligheten till IT infrastrukturen blivit allt viktigare har även behovet av att spara energi och plats kommit i fokus.

Effekta Guardian tillgodosser alla dessa behoven för mindre till medelstora serverrum/datacenter.

Effekta Guardians olika modeller inkluderar flera lösningar på de olika behov som finns i ett datacenter. Från den minsta Guardian i ett eget fristående skåp med eget kylaggregat och som är som ett eget litet serverrum i sig till de större modulära skåpen med inkoppling av extern kyla som är framtagna för att uppfylla de mest krävande behov och för att hysa kraftfulla servers.

Inuti Guardian installeras servers med all kring-utrustning såsom switchar, nätfördelning m.m. samt naturligtvis UPS aggregat med tillhörande batterier. Luftkonditioneringen optimerar både temperaturen inne i skåpet såväl som energiförbrukningen.

## Beskrivning av systemet

De större Guardiansystemet består i huvudsak av 3 olika delar:

1. Externt kyldningssystem med gas- eller vatten.
2. Skåp för distribution av kylan anslutet till kylsystemet.
3. Skåp för servers, elfördelning, UPS och batterier.

Skåpen anpassas helt efter kundens behov i första hand efter hur många serverplatser som önskas för att sedan byggas vidare och anpassas gällande kyla, fördelning, UPS effekt m.m.

## Så fungerar Guardian

Effekta Guardian är ett helt slutet system. Den kylda luften blåses ut från skåpet för kyldistributionen av fläktar och sugs i sin tur in med fläktar in i skåpet med datorna och UPSerna. Den varma luften som alstras av utrustningen sugs in i kylsystemet och ett speciellt membran separerar den varma och kalla luften. Fläktarna i kylenheten är redundanta och med variabel hastighet för att optimera energikonsumtionen och kan snabbt bytas ut utan att stänga ner systemet.

Kraftförsörjningen garanteras av (minst) två modulära, redundanta online UPSer (N+1) vilka förser utrustningen med ren, störningsfri och avbrottsfri spänning. Batteritiden anpassas helt efter kundens önskemål om tillgänglighet.

Automatisk brandsläckare i 19" utförande

Automatisk öppningsmekanism

## Tillbehör

Som beskrivs tidigare så är Guardian ett helt kundanpassat system med många tillbehör som t.ex:

- PDU kraftfördelning som är helt övervaknings- och kontrollerbar via nätet så att man kan t.ex. stänga av och på specifika uttag.
- Övervakning av omgivning för att t.ex. öppna dörrarna automatiskt vid övertemperatur, luftfuktighet, rök och vatten.
- Automatisk brandsläckare.
- KVM switchar som kan övervakas och kontrolleras.
- Kodlås till dörrarna.

# GUARDIAN SH

THE OPTIMAL SOLUTION FOR  
SMALL AND MEDIUM DATA CENTER

- AVAILABLE IN WATER AND GAS SYSTEM MODEL
- AIR-CONDITIONED CABINET
- EXCELLENT TEMPERATURE CONTROL, FOR VERY CRITICAL LOADS, INDEPENDENT, FROM ENVIRONMENTAL CONDITIONS
- OPTIMIZED SPACE, DON'T NEED A SPECIAL ROOM
- VERY EASY INSTALLATION
- LOW POWER CONSUMPTION
- PERFECT ELECTRICAL POWER SUPPLY, STABLE, REDUNDANT, WITH CONTINUITY OF POWER SUPPLY, NOISE-FREE
- READY FOR FUTURE EXPANSION OF THE COMPUTER SYSTEM

# GUARDIAN<sup>SH</sup>

## Description of the system

The modern Data Center needs considerable electrical power, even used to cool the system. The infrastructures have become more and more important and expensive: consider for example the concentration of heat produced by modern "blade servers" and the dissipation within a limited temperature window, or shortage of open spaces. It's an obligation to optimize space and power consumption.

**GUARDIAN<sup>SH</sup>** is our solution for a small and medium-size Data Center.

**GUARDIAN<sup>SH</sup>** range includes several solutions for the different Data Centers power requirements. From the small GUARDIAN<sup>SH</sup> in a sole cabinet, that is like a small data center room, to the modular GUARDIAN<sup>SH</sup> that is designed to satisfy the most powerfull computers.

**GUARDIAN<sup>SH</sup>** is an air-conditioned cabinet: inside is located the server (and its accessories as hubs, switch boards, etc ...), and the redundant modular uninterruptible power systems (UPS) with their sealed batteries. The air conditioner automatically optimizes both the temperature inside the cabinet and the energy consumption.

## GUARDIAN<sup>SH</sup> MODULAR SYSTEM

## Components of the system

The system is made of 3 main units:

- A. External Refrigerant Unit: can work with water as refrigerant, named ERW (see fig. 2), or with gas as refrigerant, named ERG (see fig. 1).
- B. Cabinet with cooling system inside, connected to external refrigerant unit through two pipelines (named CSW if water, or CSG if gas).
- C. Cabinet that can house UPS, batteries and server or only server named SU.

fig. 1 COOLING SYSTEM UNIT

fig. 2 COOLING SYSTEM UNIT

## How the GUARDIAN<sup>SH</sup> system works

The system is a closed system: the cold air comes out (forced by fans) from the front side of the cooling module: then is sucked in UPS and servers by fans. The hot air comes out from the rear part of UPS and servers, and is sucked in the cooling system. A special membrane parts the hot from the cold air. The fans in the cooling unit are redundant and with variable speed, to optimize the energy consumption, and can quickly be replaced without stopping the system.

The system is supplied by modular, redundant (N+1) UPS on line, which provides for continuity of power supply (perfect sinusoidal waveform, noise free). The inner sealed batteries provide the energy reserve in case of blackout of the mains.

The GUARDIAN<sup>SH</sup>, in a sole cabinet can be equipped with the water or gas refrigerator system, and respectively provided with an external chiller unit or a motor condensing unit. Following the standard data.

Technical Data					
WATER SYSTEM MODEL		SHW161	SHW162E1	SHW222E1	SHW323E1
Total cooling capacity	kW	16	16	22	32
Number of fans	N°	3	3	5	5
Air/flow max. (automatic variation of speed)	m <sup>3</sup> /h	2600	2600	4000	4000
Water flow (at 7-12 °C)	l/h	3700	3700	5070	6200
UPS (N+1)					
N° modules	N°	1+1	2+1	2+1	3+1
Power/module	kW	12	12	12	12
N° max batteries 9Ah/12V	N°	120	200	200	200
Back up time (N UPS load)	min	40	25	25	15
Input voltage	V/ph/Hz	400/3+N/50			
Output voltage	V/ph/Hz	400/3+N/50			
Cabinet Physical Data					
Weight	Kg	720	1180	1125	1310
Width	mm	950	1550	1550	1550
Height	mm	2100	2100	2100	2100
Depth	mm	1200	1200	1200	1200
Server rack unit available	U (44,45mm)	17	42	42	42
External chiller unit					
Input voltage	V/ph/Hz	400/3+N/50			
Cooling capacity	kW	16	16	22	32

GAS SYSTEM MODEL		ACG081	ACG081E1	ACG 202E1
Total cooling capacity	kW	8	8	20
Number of fans	N°	3	3	5
Air/flow max. (automatic variation of speed)	m <sup>3</sup> /h	2600	2600	4000
Gas refrigerant			R410A	
UPS (N+1)				
N° modules	N°	1+1	1+1	2+1
Power/module	kW	12	12	12
N° max batteries 9Ah/12V	N°	120	120	200
Back up time (N° UPS load)	min	40	40	25
Input voltage	V/ph/Hz	400/3+N/50		
Output voltage	V/ph/Hz	400/3+N/50		
Cabinet Physical Data				
Weight	Kg	720	980	1125

Depth	mm	1200	1200	1200
Server rack unit available	U (44,45mm)	17	42	42
External motor condensing unit				
Input voltage	V/ph/Hz	400/3+N/50		
Cooling capacity	kW	8	8	20

# GUARDIAN<sup>SH</sup>

GUARDIAN<sup>SH</sup> is a modular system that can be built in different configurations, depending on the needs of the Data Center. Its special feature is the possibility to be adapted to the Data Center power and dimensions. Moreover it can grow with the Data Center starting from a basic standard configuration optimizing in this way the investment costs to the real needs.

Basically two different cabinets are available.

Cabinet CSW or CSG. These are the cooling cabinets and they can work with chilled water or refrigerant gas in connection with the external units. They are combined in the modular system to cool the apparatus for server and power UPS. Their number depends on the installed power.

Cabinet SU. This type of cabinet can include the server or the battery or the UPS or a combination of them.

As from the figure below, it is possible to expand the system combining the two different cabinets depending on the Data Center requests.

The GUARDIAN<sup>SH</sup> smallest configuration includes two cabinets: one cabinet SU for the UPS, battery, and server, and the other cabinet for cooling type CSW or CSG.

Below is a typical configuration with two cabinets CSW, two cabinets SU for server apparatus and two cabinets SU for UPS and Battery.

# GUARDIAN SH

## OPTIONAL ACCESSORIES

### PDU POWER DISTRIBUTION UNIT

Bar of 20 sockets for servers: it is possible to control (from remote point) each single socket, including on /off switch by program, load current, environment temperature, humidity, water, smoke, open doors.

### AMBIENT CONTROL

- Open door
- Environment temperature and humidity
- Smoke
- Water

### FG FIREGUARD

Fire monitoring unit, with 2 smoke probes plus 2 thermo sensitive cables: to switch off the fire there is a special gas cylinder.

### KVM SWITCHES

Monitor and control servers from a single console rack version: switch with 8 or 16 ports, keyboard and touchpad.

### KEYPAD MODULE

The Keypad Module is the processing unit of the Stand-alone electronic locking system. It includes a numerical keypad as well as the data memory and the controller unit for the storage and evaluation of the input. It is possible to connect up to two handles that will be controlled by one master handle.

# GUARDIAN<sup>SH</sup>

## CONNECTIVITY

G-TEC intelligent solutions for networking allow continuous and assistant monitoring for the GUARDIAN<sup>SH</sup> system.

GUARDIAN<sup>SH</sup> can provide remote information using different ways. The user can get the status through mobile phone, SMS, PDA (personal digital assistant) and internet connections. It is possible to have a display of functional parameters and also an operational control.
